Home Page

I choose Netflix to clone because it has a lot of components that I can work with and also it's the most appealing website to look at. I scrolled through my brother's Netflix page and what type of movies and features he has on the Home page, so that I can start cloning his Netflix in VS code. There is a second page when you click the TV Shows link but unfortunately I didn't have much time to add components and make it look different from the Home page.

1) Navbar:

- Logo: Netflix Logo
- Category Links: there are Home, TV Shows, Movies, New & Popular, and My List. Also I have icons for the search, notification and profile displayed
- User menu: when you hover over the menu, it shows other users that you can login into and other information such as account, help center, and sign out page

2) Banner:

- Featured Movie Title & Description: It shows the title and description of the movie Joker.
- Play and Info buttons:

3) Movies Slides:

- Sliders: if you press the left and right arrow icon, it should slide from left to right, showing types of movies
- Movie: It's an image representing the movie which was the love hard movie

4) Card Feature:

- There is the Lovehard movie image, when you hover over it becomes bigger and it will show its card feature if you click on it. It contains more information about the movie such as duration, age, year, description and four icons which are play, add, thumbs up and down thumb.
